

## **Climate Change and Alaska – What Does the Future Hold?**

Gary Hufford<sup>1</sup>

This talk will be an overview on our present knowledge of climate in Alaska: for example, a look at surface temperature and precipitation patterns from the last 60 years and an examination of changes in the sea ice in the Bering Sea since 1970. The presentation will then take a look at the present, and see what the latest climate models say for the future.
